

## Flower Turbines at the Vakbeurs Energie 2019

From October 8-10, Flower Turbines exhibited at Vakbeurs Energie, the largest event on sustainable energy in the Netherlands. Our residential model caught the attention of every passer-by. Flower Turbines was constantly surrounded by curious crowds wondering how beauty and science could work together. The interest and compliments Flower Turbines received reflect a substantial demand for small wind.

Flower Turbines also made contact with potential partners for sales and installation. Aside from all the phone cameras focused on the turning tulip, a camera crew from the largest television channel in the Netherlands (RTL) visited Flower Turbines for a story on national television. The segment will be broadcasted by the program “Doe Maar Duurzaam” (Do it sustainably), and it will be aired sometime in November.

Many energy advisors and individuals pointed out that not only does wind energy have a lower carbon footprint than solar, but also that the weather conditions in the Netherlands are more suitable for wind energy. This is reflected by the fact that in the cloudy Dutch winters, when the demand for electricity is the highest, so are the winds.
